Dear Graduate Student:

University Health Services (UHS) would like to welcome you to Boston College. All mandatory health forms are included in this packet. The State of Massachusetts requires that all full-time graduate students and part-time graduate health science and visa carrying students submit proof of the immunizations listed on the BC Immunization Incoming Form. All forms must be completed, uploaded and entered into the Health Services Portal (see instructions below).

The deadline for submission is July 1st/Fall enrollment (January 1st/Spring enrollment). If all forms have not been uploaded and entered into the Health Services Portal within 30 days before the start of classes you will not be able to register for the following semester classes and an $85 non-refundable late fee will be applied to your student account.

Please note, you do not need to use the BC Immunization Incoming Form in the packet. You can substitute an official immunization record from your provider. The BC Immunization Incoming Form details which vaccines are required by the State of Massachusetts and those that are highly recommended by UHS. Please make sure that your documentation includes all of the required vaccines listed or positive titers where applicable as well as the completed TB Questionnaire and Testing Form. If you have not received all of the required vaccines you will need to obtain them prior to the start of classes.

To submit forms through the Health Services Portal please follow the steps below:

1. Take a picture or scan the individual forms (immunization, meningitis waiver if applicable and tuberculosis questionnaire/testing form) and save them on your computer or phone to navigate to once logged into the Health Services Portal. Do not use special characters when naming your files.
2. Navigate to the BC Agora Portal (https://services.bc.edu) and sign in using your BC username and password.
3. Under OTHER SERVICES click on the HEALTH SERVICES link.
4. Once in the Health Services Portal choose the UPLOAD ICON and upload the individual forms to their corresponding line item in the drop down menu (Note: the drop down menu is below the list of “documents available to upload”). Click SELECT FILE, choose the file you are uploading and hit the UPLOAD button with each file. The uploaded documents will appear at the bottom of the page under “Documents Already on File”. Varsity athletes are also required to upload sickle cell lab test results.
5. *Most Important Final Step: Once forms have been uploaded go to the top of the page and select the IMMUNIZATION LINK and enter the dates of all of your vaccines as indicated on your form. Once you have entered all of the vaccine dates, click the SUBMIT button.

Once completed DO NOT send your forms to UHS instead maintain them for your records in case there is a problem with the image quality and you need to resubmit them.

Thank you in advance for your cooperation and best of luck in your studies.

Yours truly,
Thomas I. Nary, M.D.
Director
University Health Services
BOSTON COLLEGE IMMUNIZATION INCOMING FORM

REQUIRED IMMUNIZATIONS

If you have chosen to use this immunization form it must be completed and signed by your health care provider. BE AWARE: MA state law requires immunization compliance. If forms have not been uploaded and entered into the Health Services Portal within 30 days before the start of classes you will not be able to register for the following semester classes and an $85 non-refundable late fee will be applied to your student account.

Information about Meningococcal Disease, Meningococcal Vaccines, Vaccination Requirements and the Waiver for Students at Colleges and Residential Schools

Colleges: Massachusetts requires all newly enrolled full-time students 21 years of age and under attending a postsecondary institution (e.g., colleges) to: receive a dose of quadrivalent meningococcal conjugate vaccine on or after their 16th birthday to protect against serotypes A, C, W and Y or fall within one of the exemptions in the law, discussed on the reverse side of this sheet.

Residential Schools: Massachusetts requires all newly enrolled full-time students attending a secondary school who will be living in a dormitory or other congregate housing licensed or approved by the secondary school or institution (e.g., boarding schools) to receive quadrivalent meningococcal conjugate vaccine to protect against serotypes A, C, W and Y or fall within one of the exemptions in the law, discussed on the reverse side of this sheet.

The law provides an exemption for students signing a waiver that reviews the dangers of meningococcal disease and indicates that the vaccination has been declined. To qualify for this exemption, you are required to review the information below and sign the waiver at the end of this document. Please note, if a student is under 18 years of age, a parent or legal guardian must be given a copy of this document and must sign the waiver.

What is meningococcal disease?
Meningococcal disease is caused by infection with bacteria called Neisseria meningitidis. These bacteria can infect the tissue that surrounds the brain and spinal cord called the “meninges” and cause meningitis, or they can infect the blood or other body organs. Symptoms of meningococcal disease may appear suddenly. Fever, severe and constant headache, stiff neck or neck pain, nausea and vomiting, sensitivity to light and rash can all be signs of meningococcal disease. Changes in behavior such as confusion, sleepiness, and trouble waking up can also be important symptoms. Less common presentations include pneumonia and arthritis. In the US, about 350-550 people get meningococcal disease each year and 10-15% die despite receiving antibiotic treatment. Of those who live, another 10-20% lose their arms or legs, become hard of hearing or deaf, have problems with their nervous systems, including long term neurologic problems, or suffer seizures or strokes.

How is meningococcal disease spread?
These bacteria are passed from person-to-person through saliva (spit). You must be in close contact with an infected person’s saliva in order for the bacteria to spread. Close contact includes activities such as kissing, sharing water bottles, sharing eating/drinking utensils or sharing cigarettes with someone who is infected; or being within 3-6 feet of someone who is infected and is coughing or sneezing.

Who is at most risk for getting meningococcal disease?
High-risk groups include anyone with a damaged spleen or whose spleen has been removed, those with persistent complement component deficiency (an inherited immune disorder), HIV infection, those traveling to countries where meningococcal disease is very common, microbiologists who work with the organism and people who may have been exposed to meningococcal disease during an outbreak. People who live in certain settings such as college freshmen living in dormitories and military recruits are also at greater risk of disease from some of the serogroups.

Are some students in college and secondary schools at risk for meningococcal disease?
In the 1990s, college freshmen living in residence halls were identified as being at increased risk for meningococcal disease. Meningococcal disease and outbreaks in young adults were primarily due to serogroup C. However, following many years of routine vaccination of young people with MenACWY vaccine, serogroup B is now the primary cause of meningococcal disease and outbreaks in young adults. Among the approximately 9 million students aged 18-21 years enrolled in college, there are an average of 20 cases and 2-4 outbreaks due to serogroup B reported annually. Although incidence of serogroup B meningococcal disease in college students is low, college students aged 18-21 years are at increased risk compared to non-college students. The close contact in college residence halls, combined with certain behaviors (such as alcohol consumption, exposure to cigarette smoke, sharing food or beverages, and other activities involving the exchange of saliva), may put college students at increased risk. There is insufficient information about whether new students in other congregate living situations (e.g., residential schools) may also be at increased risk for meningococcal disease. But, the similarity in their environments and some behaviors may increase their risk.

Is there a vaccine against meningococcal disease?
Yes, there are 2 different meningococcal vaccines. Quadrivalent meningococcal conjugate vaccine (Menactra and Menevo) protects against 4 serotypes (A, C, W and Y) of meningococcal disease. Meningococcal serogroup B vaccine (Bexsero and Trumenba) protects against serogroup B meningococcal disease. Quadrivalent meningococcal conjugate vaccine is routinely recommended at age 11-12 years with a booster at age 16. Students receiving their first dose on or after their 16th birthday do not need a booster. Individuals in certain high risk groups may need to receive 1 or more of these vaccines based on their doctor’s recommendations. Adolescents and young adults (16-23 years of age) who are not in high risk groups may be vaccinated with meningococcal B vaccine, preferably at 16-18 years of age, to provide short-term protection for most strains of serogroup B meningococcal disease. Talk with your doctor about which vaccines you should receive.
Is the meningococcal vaccine safe?
Yes. Getting meningococcal vaccine is much safer than getting the disease. Some people who get meningococcal vaccine have mild side effects, such as redness or pain where the shot was given. These symptoms usually last for 1-2 days. A small percentage of people who receive the vaccine develop a fever. The vaccine can be given to pregnant women. A vaccine, like any medicine, is capable of causing serious problems such as severe allergic reactions, but these are rare.

Is meningococcal vaccine mandatory for entry into secondary schools that provide housing, and colleges?
Massachusetts law (MGL Ch. 76, s.15D) and regulations (105 CMR 220.000) requires both newly enrolled full-time students attending a secondary school (those schools with grades 9-12) who will be living in a dormitory or other congregate housing licensed or approved by the secondary school or institution and newly enrolled full-time students 21 years of age and younger attending a postsecondary institution (e.g., colleges) to receive a dose of quadrivalent meningococcal conjugate vaccine.

At affected secondary schools, the requirements apply to all new full-time residential students, regardless of grade (including grades pre-K through 8) and year of study. Secondary school students must provide documentation of having received a dose of quadrivalent meningococcal conjugate vaccine at any time in the past, unless they qualify for one of the exemptions allowed by the law. College students 21 years of age and younger must provide documentation of having received a dose of quadrivalent meningococcal conjugate vaccine on or after their 16th birthday, regardless of housing status, unless they qualify for one of the exemptions allowed by the law. Meningococcal B vaccines are not required and do not fulfill the requirement for receipt of meningococcal vaccine. Whenever possible, immunizations should be obtained prior to enrollment or registration. However, students may be enrolled or registered provided that the required immunizations are obtained within 30 days of registration.

Exemptions: Students may begin classes without a certificate of immunization against meningococcal disease if: 1) the student has a letter from a doctor stating that there is a medical reason why he/she can’t receive the vaccine; 2) the student (or the student’s parent or legal guardian, if the student is a minor) presents a statement in writing that such vaccination is against his/her sincere religious belief; or 3) the student (or the student’s parent or legal guardian, if the student is a minor) signs the waiver below stating that the student has received information about the dangers of meningococcal disease, reviewed the information provided and elected to decline the vaccine.

Shouldn’t meningococcal B vaccine be required?
CDC’s Advisory Committee on Immunization Practices has reviewed the available data regarding serogroup B meningococcal disease and the vaccines. At the current time, there is no routine recommendation and no statewide requirement for meningococcal B vaccination before going to college (although some colleges might decide to have such a requirement). As noted previously, adolescents and young adults (16 through 23 years of age) may be vaccinated with a serogroup B meningococcal vaccine, preferably at 16 through 18 years of age, to provide short term protection against most strains of serogroup B meningococcal disease. This would be a decision between a healthcare provider and a patient. These policies may change as new information becomes available.

Where can a student get vaccinated?
Students and their parents should contact their healthcare provider and make an appointment to discuss meningococcal disease, the benefits and risks of vaccination, and the availability of these vaccines. Schools and college health services are not required to provide you with this vaccine.

Where can I get more information?
- Your healthcare provider
- The Massachusetts Department of Public Health, Division of Epidemiology and Immunization at (617) 983-6800 or www.mass.gov/dph/imm and www.mass.gov/dph/epi
- Your local health department (listed in the phone book under government)

Waiver for Meningococcal Vaccination Requirement
I have received and reviewed the information provided on the risks of meningococcal disease and the risks and benefits of quadrivalent meningococcal conjugate vaccine. I understand that Massachusetts’ law requires newly enrolled full-time students at secondary schools who are living in a dormitory or congregate living arrangement licensed or approved by the secondary school, and newly enrolled full-time students at colleges and universities who are 21 years of age or younger to receive meningococcal vaccinations, unless the students provide a signed waiver of the vaccination or otherwise qualify for one of the exemptions specified in the law.

☐ After reviewing the materials above on the dangers of meningococcal disease, I choose to waive receipt of meningococcal vaccine.

</table>

1. Did you ever receive a BCG vaccine as a child? □ Yes □ No □ Unsure
2. Have you ever had close contact with persons known or suspected to have active TB disease? □ Yes □ No
3. Have you ever had a history of a positive PPD skin test? □ Yes □ No
4. Were you born in one of the countries or territories listed above that have a high incidence of active TB disease? (If yes, please CIRCLE the country) □ Yes □ No
5. Are you a recent arrival (<5 years) from one of the high prevalence areas listed above? □ Yes □ No
   If YES please indicate date of arrival: / / 
6. Have you had frequent or prolonged visits (for more than one month) to one or more of the countries or territories listed above with a high prevalence of TB disease? (If yes, CHECK the country/countries) □ Yes □ No
7. Have you been a health care worker, volunteer, resident and/or employee of high-risk congregate settings or served clients who are at increased risk of active TB disease (e.g., correctional facilities, long-term care facilities, homeless shelter, substance abuse treatment, rehabilitation facility)? □ Yes □ No
8. Have you ever been a member of any of the following groups that may have an increased incidence of latent *M. tuberculosis* infection or active TB disease – medically underserved, low income or abusing drugs or alcohol? □ Yes □ No

If the answer is YES to any of the above questions, Boston College requires that you receive TB testing as soon as possible but at least prior to the start of the semester. Have your physician complete and return the Tuberculosis (TB) Risk Assessment on pages 2 and 3 with additional testing and/or documentation as needed.

If the answer to all of the above questions is NO, no further testing is required (no need to complete page 2 & 3).
TUBERCULOSIS (TB) RISK ASSESSMENT (to be completed by health care provider)

Clinicians should review and verify information on the TB Screening Form. Persons answering YES to any of the questions are candidates for either Mantoux tuberculin skin test (TST) or Interferon Gamma Release Assay (IGRA), unless a previous positive test is documented.

1. TB Symptom Check

**Does the student have signs or symptoms of active pulmonary tuberculosis disease?** Yes No

If No, proceed to 2 or 3

If yes, check below:

- Cough (especially if lasting for 2-3 weeks or longer) with or without sputum production
- Coughing up blood (hemoptyis)
- Chest pain
- Loss of appetite
- Unexplained weight loss, unusual weakness or extreme fatigue
- Night sweats
- Fever

Proceed with additional evaluation to exclude active tuberculosis disease including tuberculin skin testing, chest x-ray, and sputum evaluation as indicated.

2. Tuberculin Skin Test (TST)

(TST result should be recorded as actual millimeters (mm) of induration, transverse diameter; if no induration, write “0”. The TST interpretation should be based on mm of induration as well as risk factors.)**

**Date Given: / /  
Date Read: / /  
M D Y  
M D Y**

Result: mm of induration **Interpretation (please refer to interpretation guidelines): positive negative**

(If positive Chest X-Ray required see pg 3 of 3)

**Interpretation guidelines**

- **5 mm is positive:**
  - Recent close contacts of an individual with infectious TB
  - Persons with fibrotic changes on a prior chest x-ray, consistent with past TB disease
  - Organ transplant recipients and other immunosuppressed persons (including receiving equivalent of >15 mg/d of prednisone for 1 month or more)
  - HIV-infected persons

- **10 mm is positive:**
  - Recent arrivals to the U.S. (<5 years) from high prevalence areas or who resided in one for a significant amount of time
  - Injection drug users
  - Mycobacteriology laboratory personnel
  - Residents, employees, or volunteers in high-risk congregate settings for example prisons, long term care facilities, health care facilities, homeless shelters, residential facilities for patients with HIV/AIDS
  - Persons with medical conditions that increase the risk of progression to TB disease including silicosis, diabetes mellitus, chronic renal failure, certain types of cancer/hematologic disorders (leukemias and lymphomas, cancers of the head, neck, or lung), gastrectomy or jejunoileal bypass and weight loss of at least 10% below ideal body weight.
  - Children < than 4 years of age or infants, children and adolescents exposed to adults at high-risk

- **15 mm is positive:**
  - Persons with no known risk factors for TB who, except for certain testing programs required by law or regulation, would otherwise not be tested.

*The significance of the travel exposure should be discussed with a health care provider and evaluated.*

Health Care Provider’s Signature: ____________________________ (Continue on page 3)

3. Interferon Gamma Release Assay (IGRA)
   Date Obtained: ______/____/____ (specify method) QFT-GIT  T-Spot  other ______
   M  D  Y
   Result: negative____  positive____  indeterminate____  borderline____ (T-Spot only)

4. Chest x-ray: (Required if TST or IGRA is POSITIVE)
   Date of chest x-ray: ______/____/____ Result: normal____  abnormal____
   M  D  Y

TUBERCULOSIS (TB) RISK ASSESSMENT Management of Positive TST or IGRA

All students with a positive TST or IGRA with no signs of active disease on chest x-ray should receive a recommendation to be treated for latent TB with appropriate medication. However, students in the following groups are at increased risk of progression from LTBI to TB disease and should be prioritized to begin treatment as soon as possible.

- Infected with HIV
- Recently infected with *M. tuberculosis* (within the past 2 years)
- History of untreated or inadequately treated TB disease, including persons with fibrotic changes on chest radiograph consistent with prior TB disease
- Receiving immunosuppressive therapy such as tumor necrosis factor-alpha (TNF) antagonists, systemic corticosteroids equivalent to/greater than 15 mg of prednisone per day, or immunosuppressive drug therapy following organ transplantation
- Diagnosed with silicosis, diabetes mellitus, chronic renal failure, leukemia, or cancer of the head, neck, or lung
- Have had a gastrectomy or jejunoileal bypass
- Weigh less than 90% of their ideal body weight
- Cigarette smokers and persons who abuse drugs and/or alcohol

**Populations defined locally as having an increased incidence of disease due to *M. tuberculosis*, including medically underserved, low income populations**

MEDICATION SECTION:

Was the patient educated and counseled on latent tuberculosis and advised to take medication because of the positive results?  NO_______ YES ______

_______ Patient agrees to receive treatment

If yes, what medication(s) was prescribed? _______________ Date Started: ______/____/____ Date Ended: ______/____/____

_______ Patient declines treatment at this time
