Parents of Children with Medical Complexity and Traumatic Stress: Improving Care for Patients and Families

Sandra Clancy, PhD
Justine Dellaria, LICSW
Introductions
Children with Complex Medical Needs

- Statistics
- Medically fragile
- High risk
- Heavy utilizers
- Their parents are an under-studied demographic

Children with Complex Medical Conditions: an Under-Recognized Driver of the Pediatric Cost Crisis
*Current Treatment Options Pediatrics* (2016) 2:289-295
Caregivers often experience:

- enhanced stress
- poor health
- marital discord
- financial consequences

PEDIATRICS Volume 127, Number 3, March 2011
Research on Family Health and Children and Youth with Special Health Care Needs (2022)

- Physical health is worse; poor sleep; stress leads to neuroendocrine dysfunction, elevated systemic inflammation and poor immune response
- Depression, anxiety, stress
- Medical trauma and post traumatic stress disorder
- Literature is limited and there are gaps in it. “Paucity of literature about the causes and implementation of programs that address these family needs.” “Poor understanding of factors impacting mental health.”

Academic Pediatrics, Volume 22, Number 2S, March 2022
Mental Health and Wellbeing of Caregivers of Children with Medically Complex Conditions During COVID-19

Emmanuel Ayee, MD1, James M Parrin, MD12, Caitlin Marrill, NP1, Marjorie Curran, MD1, Patricia J O'Malley, MD1, Sandra Clancy, PhD1, and Nicholas M. Oreskovic, MD, MPH1
1. Mass General Hospital for Children, Boston, Massachusetts and 2. Harvard Medical School, Boston, Massachusetts

Background

- Care for children with medically complex conditions creates multiple demands on caregivers, exacerbated during a pandemic.
- Previous research has highlighted the chronic stress experience of caregivers with resultant calls to raise awareness about the issue.
- Several reports have described caregiver burden during the pandemic. Few studies, however, have focused on the mental health and wellbeing of caregivers of children with medically complex conditions.
- Recent consolidation of two Mass General Hospital for Children (MGHFC) programs for children with medically complex conditions has led to a new integrated Courageous Kids (CK) program.
- This new program afforded an opportunity to survey parents of program children.

Objective

To assess mental health and wellbeing among caregivers of children in the CK program during COVID-19.

Design/Methods

- We conducted an online cross-sectional survey of caregivers of patients in the CK program from April 2020 to April 2021 (n=65).
- We assessed caregiver mental health and wellbeing using the Short Form Health Survey (SF-20) and Impact on Family Scale (IOF).

Results

</tbody>
</table>

- Average caregiver SF-20 mental health score was 57.1 (reference mean = 72.6 ± 20.2).
- Physical and role functioning scores were 81.6 (reference mean = 78.5 ± 30.8) and 88.1 (reference mean = 77.5 ± 38.3) respectively.
- Social functioning score was 88.1 (reference mean = 67.2 ± 23.6).
- Total impact on family score was 64.9 (reference mean = 59.0 ± 9.5).
- Financial burden and personal strain scores were 15.6 (reference mean = 10.4 ± 2.2) and 20.8 (reference mean = 16.0 ± 3.5) respectively.

Conclusion

- Caregivers of children with medically complex conditions report lower mental health scores and higher family burden scores as well as more financial burden and personal strain than normative samples.
- Further studies will examine key demographic differences in these scores.
- Timely and appropriate interventions might improve the mental health and wellbeing of caregivers of children with medically complex conditions.

Contact: eayee@mgh.harvard.edu
Mothers and fathers of children with illness each had 61% and 55% higher overall rates of healthcare encounters, diagnoses, and prescriptions compared with parents of control children.

Parents Self-Report

Negative effects in physical health, family life, marriage, social life, finances, education, and career;
Greater symptoms of post traumatic distress, greater emotional distress, higher levels of anxiety, fewer healthy behaviors, sleep disturbances, lower quality of life

Allostatic Load

Allostatic load refers to the cumulative burden of chronic stress and life events. It involves the interaction of different physiological systems at varying degrees of activity. When environmental challenges exceed the individual ability to cope, then allostatic overload ensues. Allostatic load is identified by the use of biomarkers and clinical criteria.
What We See

- Greater subspecialty care
- Coordination is a challenge – CCC, iCMP
- Pediatric Palliative Care
  - Fragmentation
  - Complexity
- Parents are overwhelmed
DEGREES OF STRESS

POSITIVE
Brief increases in heart rate; intensified focus; mild elevation in levels of stress hormones

TOLERABLE
Serious but temporary stress responses mitigated by positive, buffering influences or relationships

TOXIC
Intense and prolonged activation of stress response systems without positive, buffering influences or relationships
BRAIN
Difficulty concentrating, anxiety, depression, irritability, mood, mind fog

CARDIOVASCULAR
higher cholesterol, high blood pressure, increased risk of heart attack and stroke

JOINTS AND MUSCLES
increased inflammation, tension, aches and pains, muscle tightness

IMMUNE SYSTEM
decreased immune function, lowered immune defenses, increased risk of becoming ill, increase in recovery time

SKIN
hair loss, dull/brittle hair, brittle nails, dry skin, acne, delayed tissue repair

GUT
nutrient absorption, diarrhea, constipation, indigestion, bloating, pain and discomfort

REPRODUCTIVE SYSTEM
decreased hormone production, decrease in libido, increase in PMS symptoms
Anticipatory Grief

Similar feelings associated with grief
Every emotional is normative – can feel more like a rollercoaster
Find ways to take control
Spend quality time together, opportunities for engagement / memory making
Share your feelings, be honest
Make time for ”normal” routine and activities
Continue to engage in self-care (physical and emotional)
Know when to get professional support
What do parents need?

- Recognition of trauma of the system
- Validation
- Self-compassion to combat guilt
- Basic physical help in the home
- Sibling support
- Sense of control AND adequate support
- Providers who are well-trained in communication
- Help with finances
- Grief work and end of life care
- Spiritual needs met
- Mental health needs met
- Opportunities for advocacy
Where are parents getting support?

- Informal supports
- Online supports
- Seeking individual supports – Therapy
  - Insurance/accessibility
  - Self-help / Self-care
The Path to Wellness

Authentic and Sustainable Self-Care Begins With You:

• Self-compassion
• Purposeful engagement
• Connectedness
• Exchange information and feelings with people who can validate you.
• Clarify your personal boundaries. What works for you; what doesn’t.
• How does your stress impact your mind? Your body?

Mindfulness Meditation

A mental state that involves being fully focused on "the now" so you can acknowledge and accept your thoughts, feelings, and sensations without judgment. Mindfulness meditation is a mental training practice that teaches you to slow down racing thoughts, let go of negativity, and calm both your mind and body.
“Not only does this enrich the present moment activity/experience you're engaging in, but it also allows you to be present in your time rather than going back into the past or into the future.”

- **Brushing your teeth:** Feel your feet on the floor, the brush in your hand, and your arm moving up and down.
- **Doing dishes:** Savor the feeling of the warm water on your hands, the look of the bubbles, and the sounds of the pans clunking on the bottom of the sink.
- **Doing laundry:** Pay attention to the smell of the clean clothes and feel of the fabric. Add a focus element and count your breaths as you fold laundry.
- **Driving:** Turn off the radio—or put on something soothing, like classical music—imagine your spine growing tall, find the half-way point between relaxing your hands and gripping the wheel too tightly, and whenever you notice your mind wandering, bring your attention back to where you and your car are in space.
- **Exercising:** Instead of watching television while on the treadmill, try focusing on your breathing and where your feet are in space as you move.
- **Getting kids ready for bed:** Get down to the same level as your kids, look in their eyes, listen more than you talk, and savor any snuggles. When you relax, they will too.
Writing Therapy

- Write a letter to your former or future self
  - What are you proud of?
  - What have you overcome?
  - What do you need to remember?
- 3 Soul Questions
  - What enlivens you?
  - What drains you?
  - What does your soul most long for?
- Write a letter to the person who has been most influential or supportive.
- What is some regret or resentment that needs to be rewritten?
- What are you grateful for? Things you appreciate?

Final thoughts

• Despite gaps in the research, we see parents’ trauma and stress
• Drawn from research of other populations
• Impact on the mind and body is real
• Self-care is important and a way to protect from the impact of toxic stress
